Jakarta Server Pages (.JSP)--View

In the project JobFinder we have three .jsp files named as
Main-menu.jsp- Have content of the home page to be displayed on the browser once the server sends a response to the client.
Visitor-form.jsp- Have main content where the visitor will fill his/her details and then it will be stored by Model attribute.
Visitor-details.jsp- Is the file where the data entered by the visitor is stored and displayed back to the visitor as a response.

main-menu.jsp

```html
<h3>Main Menu</h3>
<h3>Are you a visitor?</h3>

<a href="visitor/showForm">
        <button>click for Form</button>
</a>
```

The above snippet is in the body tag of main-menu.jsp

visitor-form.jsp

```html
<h3>Visitor Form</h3>
<form:form action="processForm" modelAttribute="visitor">
        First Name:(*) <form:input path="firstName" />
        <form:errors path="firstName" cssClass="error" />
        Last Name: <form:input path= "lastName" />
        <br><br><hr>
        City:
        <form:select path="city">
                <form:options items="${visitor.cityOptions }" />
                <br><br>
        </form:select><hr>
        <p> Can you relocate ? </p>
                Yes <form:radiobutton path="relocate" value="Yes" />
                No <form:radiobutton path="relocate" value="No" />
        <br><br><hr>
        Languages Known:
        Hindi <form:checkbox path="languagesKnown" value="Hindi" />
        English <form:checkbox path="languagesKnown" value="English" />
        Marathi <form:checkbox path="languagesKnown" value="Marathi" />
        German <form:checkbox path="languagesKnown" value="German" />
        Korean <form:checkbox path="languagesKnown" value="Korean" />
        <br><br><hr>
        Country Code: <form:input path="conCode" />
        <form:errors path="conCode" cssClass="error" />
        <br><br><hr>
        <input type="submit" value="submit" />
</form:form>
```

```html
<style>.error{color:red;}</style>
```

Above are code snippets for the main HTML form which visitor will submit along with CSS style.

Jakarta Server Pages (.JSP)--View

Visitor-details.jsp

```
The Visitor details are: ${visitor.firstName }${visitor.lastName}<br><hr>
City: ${visitor.city }<br><hr>
Can Relocate: ${visitor.relocate}<br>
<hr>
Languages Known:
<ul>
    <c:forEach var="temp" items="${visitor.languagesKnown }">
    <li>${temp}</li>
    </c:forEach>
</ul><hr>
Country Code: ${visitor.conCode}<hr>
```

The jsp files are returned by the controller methods. These are the views part of Spring MVC architecture and the response by the server to the client.
